sustained because wolves have access to better nutrition, which directly and positively impacts adult health and wolf reproduction The reverse happens when there are fewer deer The lower 2013 population estimate correlates well with the fact that wolves' primary food sources have declined in the forested portions of Minnesota

Some things to consider Understanding

- Wolves and bears are skilled predators, and may kill up to 80% of the moose or caribou that die each year
- Predator control programs are active on less than 10% of the state's land mass
- Predator control is a regulated effort to reduce the number of wolves and bears in an effort to increase the number of moose or caribou
